1 Introduction

The sseqpages package consists of two main environments – the <u>sseqdata</u> environment, which specifies the data for a named spectral sequence diagram, and the **sseqpage** environment, which prints a single page of a spectral sequence diagram. The command \printpage is also available as a synonym for a sseqpage environment with an empty body.

Here is a basic example:

```
\begin{sseqdata} [name=ex1,cohomological Serre grading]
\class(0,0)
\class(0,2)
\class(3,0)
\class(3,2)
\d3(0,2)
\end{sseqdata}
\printpage [name=ex1,page=3] \hskip1cm
\printpage [name=ex1,page=4]
```

\begin{sseqdata} [name=ex1,degree={#1}{1-#1}] starts the declaration of the data of a spectral sequence named ex1 whose page r differentials go r to the right and down r-1 (this is cohomological Serre grading). Then we specify four classes and one page 3 differential, and we ask sseqpages to print the third and fourth pages of the spectral sequence. Note that on the fourth page, the source and target of the differential have disappeared.

2 The Environments

```
\begin{sseqdata}[\langle options \rangle]\\ \langle environment\ contents \rangle\\ \begin{sseqdata}\\ \end{sseqdata} \end{sseqdata}
```

The <u>sseqdata</u> environment is for storing a spectral sequence to be printed later. This environment is intended for circumstances where you want to print multiple pages of the same spectral sequence. When using the <u>sseqdata</u> environment, you must use the <u>name</u> option to tell <u>sseqpages</u> where to store the spectral sequence so that you can access it later.

```
\begin{sseqpage} [\langle options \rangle] \\ \langle environment\ contents \rangle \\ \begin{sseqpage} \end{sseqpage}
```

This environment is used for printing a page of existing spectral sequence that was already specified using the **sseqdata** environment. The body of the environment adds local changes – classes, differentials, structure lines, and arbitrary tikz options that are by default only printed on this particular page. The **sseqpage** environment can also be used to print a standalone page of a spectral sequence – that is, if you only want to print a single page of the spectral sequence, you can skip using the **sseqdata** environment.

```
\printpage[\langle options \rangle]
```

This command prints a single page of an existing spectral sequence as-is. This is equivalent to a sseqpage environment with an empty body.

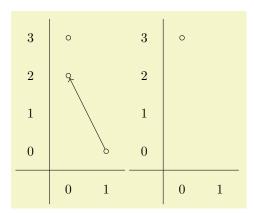

3 The main commands

```
\cline{class}[\langle options \rangle](\langle x \rangle, \langle y \rangle)
```

This places a class at (x,y) where x and y are integers. If multiple classes occur at the same position, sseqpages will automatically arrange them in a pre-specified pattern. This pattern may be altered using the class pattern option.

The effect of the \class command is to print a TikZ node on a range of pages. Any option that would work for a TikZ \node command will also work in the same way for the \class , \replaceclass, and \class options commands.

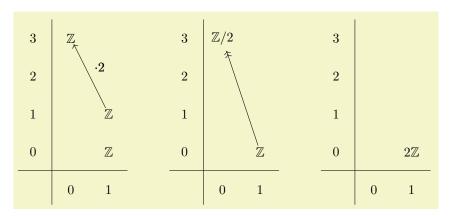

If a class is the source or the target of a differential on a certain page, then the page of the class is set to that page, and the class is only rendered on pages up to that number:

```
\begin{sseqdata} [name=class example, Adams grading]
\class(1,0)
\class(0,2)
\class(0,3)
\d2(1,0)
\end{sseqdata}
\printpage[name=class example, page=2]
\printpage[name=class example, page=3]
```

See the class options section for a list of the sort of options available for classes.

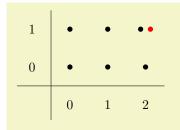

After a class is the source or target of a differential, it disappears on the next page. However, some differentials are not injective or not surjective. Using the command \replaceclass causes a new symbol to appear on the page after a class supported or accepted a differential (or both).

```
\begin{sseqdata}[name=replace class example, Adams grading, classes={draw=none}, math nodes]
\class["\mathbb{Z}\"](0,3)
\class["\mathbb{Z}\"](1,1)
\class["\mathbb{Z}\"](1,0)
\d["\cdot 2"]2(1,1)
\replaceclass["\mathbb{Z}\/2"](0,3)
\d[->>]3(1,0)
\replaceclass["2\mathbb{Z}\"](1,0)
\end{sseqdata}
\printpage[name=replace class example, page=2]
\hskip1cm
\printpage[name=replace class example, page=3]
\hskip1cm
\printpage[name=replace class example, page=4]
```

$\cline{classoptions}[\langle options \rangle](\langle x \rangle, \langle y \rangle, \langle n \rangle)$

This adds options to a class that already exists. If there are multiple classes at the coordinate (x,y) you must specify which using an integer or a tag n. This can be used in a sseqpage environment to modify the appearance of a class for just one drawing of the spectral sequence, for instance to highlight it for discussion purposes:

```
\begin{sseqdata}[name=class options example, classes=fill]
\class(2,1)
\foreach \x in {0,...,2} \foreach \y in {0,1}{
    \class(\x,\y)
}
\end{sseqdata}
\begin{sseqpage}[name=class options example, right clip padding=0.6cm]
\classoptions[red](2,1,2) % Will only show up as red on this page!
\node[background, text width=10em] at (0.3,-2.2)
    {\textup{The red class is the problem}};
\end{sseqpage}
```

The red class is the problem

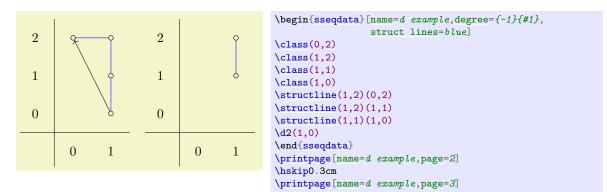

Another reason to use this is to give a label to one instance of a class that shows up in a loop or a command defined using \sseqnewgroup:

```
\sseqnewgroup\mygroup{
                                             \class(0,0)
4
                                             \class(0,1)
                                             \class(0,2)
                                             \class(1,1)
3
                                             \class(2,2)
                                             \structline(0,0)(0,1)
                                             \operatorname{tructline}(0,1)(0,2)
2
                                             \operatorname{tructline}(0,0)(1,1)
                                             \operatorname{tructline}(1,1)(2,2)
1
      2
                                        \begin{seqpage}[classes=fill,class labels=\{left=0.3em\},math nodes]
                                        \mygroup(0,0)
                                        \mygroup(1,2)
0
                                        \classoptions["2"](0,1)
                                        \classoptions["\eta"](1,1)
                                        \end{sseqpage}
                       2
                               3
        0
               1
```

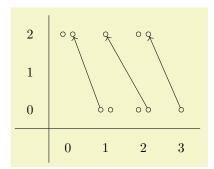

See the class options section for a list of the sort of options available for classes.

$\d[\langle options \rangle] \langle page \rangle \langle source\ coordinate \rangle$

This creates a differential starting at $\langle source\ coordinate \rangle$ of length determined by the specified page. In order to use the \d command, you must first specify the degree of the differentials as an option to the sseqdata or sseqpage environment. The degree indicates how far to the right and how far up a page r differential will go as a function of r. If there is a page r differential, on page r+1, the source, target, and any \structlines connected to the source and target of the differential disappear.

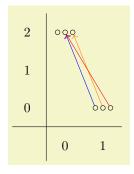

If there are multiple nodes in the source or target coordinate, then there is a funny syntax for indicating which one should be the source and target: $\d\langle page \rangle (\langle x \rangle, \langle y \rangle, \langle source \ n \rangle, \langle target \ n \rangle)$

```
\begin{sseqpage} [Adams grading]
\class(1,0)\class(1,0)
\class(0,2)\class(0,2)
\d2(1,0,1,2)
\class(2,0)\class(2,0)
\class(1,2)
\d2(2,0,2)
\class(3,0)
\class(2,2)\class(2,2)
\d2(3,0,,2)
\end{sseqpage}
```

Negative indices will count from the most recent class in the coordinate (so -1 is the most recent, -2 is the second most recent, etc):

```
\begin{sseqpage} [Adams grading]
\class(1,0)
\class(0,2)\class(0,2)
\d[blue] 2(1,0,-1,-1)
\class(1,0)
\class(0,2)
\d[orange] 2(1,0,-1,-1)
\class(1,0)
\d[red] 2(1,0,-1,-2)
\end{sseqpage}
```

You can also use a tag.

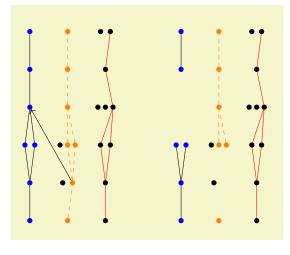

$\langle doptions | \langle options \rangle | \langle page \rangle \langle source \ coordinate \rangle$

This command adds options to an existing differential, just like \classoptions except for differentials.

$\times_{anny} \$

This command creates a structure line from $\langle source\ coordinate \rangle$ to $\langle target\ coordinate \rangle$. The source and target coordinates are of the form $(\langle x \rangle, \langle y \rangle, \langle n \rangle)$. If there are multiple classes at (x,y), then $\langle n \rangle$ specifies which of the classes at (x,y) the structline starts and ends at – if n is positive, then it counts from the first class in that position, if n is negative, it counts backwards from the most recent. You can also use a tag for n.

If the source or target of a structure line is hit by a differential, then on subsequent pages, the structure line disappears.

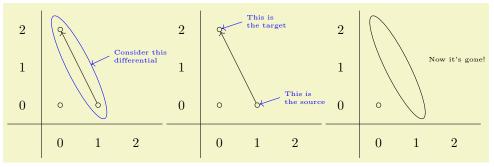

```
\sseqnewgroup*\tower{
    \class(0,0)
    \class(0,2)
    \foreach \y in\{1, ..., 5\}
        \class(0,\y)
        \structline(0,\y-1,-1)(0,\y,-1)
    \text{structline}(0,1,-1)(0,2,-2)
    \text{structline}(0,2,-2)(0,3,-1)
\begin{sseqdata} [name=structline example,
                  classes={circle,fill},
                  Adams grading, no axes]
\class(1,1)\class(1,2)
\class(2,3)\class(2,3)\class(2,5)
\tower[classes=blue](0,0)
\tower[struct lines=dashed,orange](1,0)
\tower[struct lines=red](2,0)
d2(1,1,2)
\end{sseqdata}
\verb|\printpage[name=structline example,page=2]| \\
\hskip1cm
\printpage[name=structline example,page=3]
```

 $\structlineoptions[\langle options \rangle] \langle source\ coordinate \rangle \langle target\ coordinate \rangle$

This command adds options to an existing structure line, just like \classoptions except for structure lines.

$3.1 \quad TikZ Primitives$

Any code that would work in a tikzpicture environment will also work unchanged in a sseqdata or sseqpage environment, with a few minor differences. This is a very flexible way to add arbitrary background or foreground features to the spectral sequence:

```
\class(0,0)
\class(1,0)
\class(0,2)
\d2(1,0)
\end{sseqdata}
\begin{seqpage}[name=tikz\ example, sseq=\{blue, font=\tiny\}]
\circleclasses[name path=myellipse,inner sep=3pt,ellipse ratio=1.6] (1,0)(0,2)
\hat{1}
\draw[->,name intersections={of=myellipse and myline}] (1.3,1.3)--(intersection-1);
\node[right,text width=1.6cm] at (1.3,1.3) {Consider this differential};
\end{sseqpage}
\begin{seqpage}[name=tikz\ example, sseq={<-,blue, font=\tiny}]
\draw[xshift=1](0,0) to (0.6,0.2) node[right,text width=1.1cm] {This is the source};
\draw[yshift=2](0,0) to (0.6,0.2) node[right,text width=1.1cm] {This is the target};
\end{sseqpage}
\begin{sseqpage} [page=3,name=tikz example]
\circleclasses[name path=myellipse,inner sep=3pt,ellipse ratio=1.6] (1,0)(0,2)
\node[right,font=\tiny] at (1.2,1.2) {Now it's gone!};
\end{sseqpage}
```

The following two keys are special to TikZ primitives:

background (no value)

This key instructs sseqpages to put the current TikZ primitive in the background. The way that the spectral sequence is printed is as follows:

- The title, axes, axes ticks, and axes labels are printed (the appropriate steps are skipped when the no title, no axes, no ticks, or no labels keys are used or if no title or axes labels are provided).
- The TikZ background paths are printed.
- The clipping is inserted (unless the no clip key is used).
- All foreground elements (classes, differentials, structlines, and normal TikZ paths) are printed.

In particular, this means that foreground TikZ paths can be clipped by the standard clipping, but background paths that are outside of the clipping expand the size of the Tikz picture.

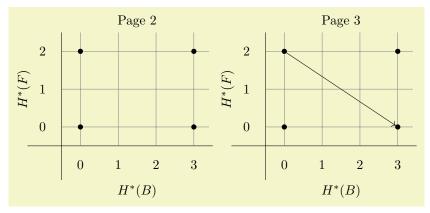

```
\begin{sseqpage} [no ticks]
\class(0,0)
\class(1,1)
\begin{scope} [background]
\draw(0.1,0.1)--(1.1,1.1);
\end{scope}
\notelipped

notelipped

notelipped

\lambda (0.5,-0.35) {clipped};
\end{sseqpage}
```

Here is an example where TikZ labels with the background key are used to add labels and a grid. Note that the following example can be made more easily using the title, x label, y label, and grid options.

```
\begin{sseqdata} [name=tikz background example, cohomological Serre grading, math nodes,
                 classes=fill]
\begin{scope}[background]
\node at (\xmax/2,\ymax+0.8) {\textup{Page \page{}}};
\node at (\xmax/2,-1.7) \{H^*(B)\};
\node[rotate=90] at (-1.5,\ymax/2) {H^*(F)};
\draw[step=1cm,gray,very thin] (\xmin-0.5,\ymin-0.5) grid (\xmax+0.4,\ymax+0.5);
\end{scope}
\class(0,0)
\class(3,0)
\class(0,2)
\class(3,2)
\d3(0,2)
\end{sseqdata}
\printpage[name=tikz background example, page=2]
\printpage[name=tikz background example, page=3]
```

```
\begin{array}{ll} \mathsf{page} \ \ \mathsf{constraint=} \langle \mathit{predicate} \rangle & (\mathsf{no} \ \mathsf{default}) \\ \mathsf{page} \ \ \mathsf{constraint} \ \ \mathsf{or=} \langle \mathit{predicate} \rangle & (\mathsf{no} \ \mathsf{default}) \end{array}
```

This places a constraint on the pages in which the TikZ primitive is printed. This predicate should look something like (page = 4) (page = 3). The predicate is anded together with any previous predicates, so that you can use this as an option for a scope and again for the individual TikZ primitive.

```
\isalive(\langle coordinate \rangle)\isalive\{(\langle coordinate 1 \rangle) \cdots (\langle coordinate 1 \rangle) \cdots (\langle coordinate n \rangle)\}

This command can only be used with page constraint. Saying

page contraint={\isalive(\langle x), \langle y \rangle, \langle n \rangle)}

will print the TikZ primitive only on pages where the specified class is alive. Saying

page contraint={\isalive(\langle coordinate 1 \rangle) \cdots (\langle coordinate n \rangle)}

is equivalent to

page constraint={\isalive(\langle coordinate 1 \rangle) && \cdots && \isalive(\langle coordinate n \rangle)}
```

```
Writing
```

```
\frac{1}{0} \draw[page constraint={\isalive(1,0)(2,2)}](1,0)--(2,2);
```

has the same result as \structline(1,0)(2,2), except that you can't later use \structlineoptions on it.

4 Options for the main commands

4.1 Universal options

The following options work with all of the drawing commands in this package, including \class , \d , and \structline , their friends \replaceclass , \classoptions , \doptions , and \structlines , as well as with \structlines primitives.

```
xshift=\langle integer \rangle \quad \text{(no default)} \quad \quad \text{(no default)} \quad \quad \text{(no default)} \quad \quad \quad \text{(no default)} \quad \
```

Shifts by integer values are the only coordinate changes that are allowed to be applied to \class, \d, \structline, their relatives, or to a scope environment that contains any of these commands. These shift commands help with reusing code. For instance:

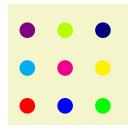

This code segment is very useful so sseqpages has the command \sseqnewgroup which to make code like this more convenient. The following code produces the same output as above:

```
\sseqnewgroup\examplegroup{
   \class(2,0)
   \class(0,1)
   \d2(0,1)
}
\begin{sseqpage}
\examplegroup(0,0)
\examplegroup(0,1)
\examplegroup(1,0)
\examplegroup(1,1)
\end{sseqpage}
```

A word of warning: the behavior of xshift in sseqpages is incompatible with the normal behavior of xshift in TikZ. For some reason, saying xshift=1 in TikZ does not shift the coordinate (0,0) to the coordinate (1,0) – instead it shifts by 1pt. In sseqpages, saying xshift=1 moves the coordinate (0,0) to the coordinate (1,0). This includes TikZ primitives: saying \draw[xshift=1] (0,0) –- (1,0); inside a sseqdata or sseqpage environment is the same as saying \draw(1,0) -- (2,0); despite the fact that this is not the case in the tikzpicture environment.

Colors

These come from the LATEX color package, so see the color package documentation for more information

```
\begin{sseqpage} [classes={fill,inner sep=0.4em}, no axes] \class[red](0,0) \class[blue](1,0) \class[green](2,0) \class[cyan](0,1) \class[magenta](1,1) \class[magenta](2,1) \class[blue]50!red](0,2) % a 50-50 blend of blue and red \class[green!30!yellow](1,2) % 70% green, 30% yellow \class[blue!50!black](2,2) \end{sseqpage}
```

$"\langle text \rangle "\langle options \rangle$

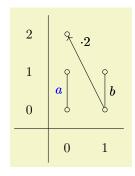

Specify a label for a class, a differential, or a structure line. This uses the TikZ quotes syntax. The options include anything you might pass as an option to a TikZ node, including arbitrary coordinate transforms, colors, opacity options, shapes, fill, draw, etc. The behavior is a little different depending on whether you use it on a class or on a differential or struct line.

For a class, the $\langle text \rangle$ is placed in the position inside the node by default – in effect, the $\langle text \rangle$ becomes the label text of the node (so saying \class["label text"](0,0) causes a similar effect to saying \node at (0,0) {label text};). There are other position options such as left, above left, etc which cause the label text to be placed in a separate node positioned appropriately. If the placement is above, left, etc, then any option that you may pass to a TikZ node will also work for the label, including general coordinate transformations. If the placement is "inside", then the only relevant $\langle options \rangle$ are those that alter the appearance of text, such as opacity and color.

```
\begin{sseqpage} [no axes,classes={minimum width=width("a")+0.5em}]
\class["a"](0,0)
\class["a",red](1,0)
\class["a" black,red](2,0)
\class["b" above](0,1)
\class["b" {below right,yshift=0.1cm}](1,1)
\class["a" {above right={1em}}](2,1)
\end{sseqpage}
```

You can adjust the default behavior of class labels using the labels, class labels, inner class labels or outer class labels style options. Note that it is also possible to give a label to a \node this way, although the behavior is slightly different. In particular, the label defaults to the above position instead of going in the \node text by default. Also, this won't respect the various label style options like labels, etc.

For either a \structline or a \class the label normally goes on the right side of the edge. The special 'option makes it go in the opposite position from the default. I copied the code to handle this from the tikzcd package, so if you use tikzcd, this should be familiar.

```
\begin{sseqpage} [Adams grading, math nodes]
\class(0,0)
\class(0,1)
\class(0,2)
\structline["a"' blue](0,0)(0,1)
\class(1,0)
\class(1,0)
\class(1,1)
\structline["b"](1,0)(1,1)
\d["\cdot 2"{pos=0.8}]2(1,0)
\end{sseqpage}
```

You can use the style options labels, edge labels, differential labels, and struct line labels to adjust the styling of edge labels. For instance, if you would prefer for the labels to default to the left

hand side of the edge rather than the right hand side, you could say edge_labels={auto=left}. You can also use quotes to label edges drawn with TikZ primitives:

The special option "description," stolen from tikzcd, places the label on top of the edge. In order to make this option work correctly, if the background color is not the default white, you must inform sseqpages about this using the key background color= $\langle color \rangle$. In this document, the background color is called graphicbackground.

```
\lambda a' b c \lambda c \
```

4.2 Options for \class

Because the main job of the \class command is to print a TikZ \node on the appropriate pages of the spectral sequence, most options that would work for a TikZ node also work for the commands \class , \replaceclass , and \classoptions . Here are a few that you might care about:

A TikZ shape

If you give the name of a TikZ shape, the class node will be of that shape. The standard TikZ shapes are circle and rectangle, but there are many more TikZ shapes in the shapes library, which you can load using the command $\scalebox{usetikzlibrary{shapes}}$. The following are some examples:

See the PGF manual section on the shape library for more information.

```
\begin{array}{ll} \operatorname{minimum\ width=}\langle \mathit{dimension}\rangle & (\operatorname{no\ default}) \\ \operatorname{minimum\ height=}\langle \mathit{dimension}\rangle & (\operatorname{no\ default}) \\ \operatorname{minimum\ size=}\langle \mathit{dimension}\rangle & (\operatorname{no\ default}) \\ \operatorname{inner\ sep=}\langle \mathit{dimension}\rangle & (\operatorname{no\ default}) \\ \operatorname{outer\ sep=}\langle \mathit{dimension}\rangle & (\operatorname{no\ default}) \\ \end{array}
```

These options control the size of a node. This is typically useful to make the size of nodes consistent independent of the size of their label text. For instance:

 $name = \langle node \ name \rangle$ (no default)

The \c lass command makes a TikZ node on appropriate pages. You can refer to this node using TikZ commands by using coordinates. Using the name option, you can give the node a second shorter name. One potential benefit to this is that it is immune to coordinate transformations. For example, in the following code, xshift does not apply to the nodes specified by (id) and (eta) but does apply to the coordinate specified by (1,1):

```
\begin{sseqpage}
\class[name=id](0,0)
\class[name=eta](1,1)
\class(2,1)
\draw[xshift=1] (id) -- (eta);
\draw[xshift=1,blue] (id) -- (1,1);
\end{sseqpage}
```

 $tag=\langle tag \rangle$ (no default)

This key adds a tag to the current class. Tags are used for identifying which of multiple classes in the same position you are referring to. They are useful when you have groups of related classes and want a family of differentials connecting them. For instance:

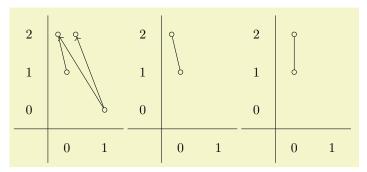

```
\sseqnewgroup*\tower{
   \class(0.0)
   foreach i in {1,...,11}{
      \class(0,\i)
      \structline(0, i-1, -1)(0, i, -1)
\sseqnewgroup\hvee{
   \tower(0,0)
   \class(\i,\i)
      \structline(\i-1,\i-1,-1)(\i,\i,-1)
\text{tower}(3,0)
\hvee[tag=h_{21}](4,2)
\foreach \n in \{0, \ldots, 5\}
   d2(4+n,2+n,h_{21},id)
\end{sseqpage}
```

We want each differential to go from the h_{21} vee to the id vee, independent of which classes are in the same position of the two vees. The easy way to accomplish this is by giving tags to each of the two vees.

```
offset = \{(\langle xoffset \rangle, \langle yoffset \rangle)\}  (no default)
```

By default, a class uses the offset specified by **class pattern**. Occasionally this is undesirable. In this case, you can specify the offset for a particular class by hand. For example if the sum of two classes is hit by a differential, it looks better for the class replacing them to be centered:

```
\begin{array}{ll} \mathtt{page=}\langle page \rangle \text{--}\langle page\_max \rangle & \text{(no default)} \\ \mathtt{generation=}\langle generation \rangle \text{--}\langle generation\_max \rangle & \text{(no default)} \end{array}
```

These options only work in \classoptions. The page option gives a range of pages for which the options apply to. If only one page is specified, it is the minimum page and the option applies to all larger pages.

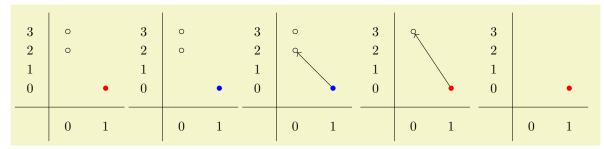

\printpage[name=page_example,page=4]

A "generation" of a class is the interval from one call of \class or \replaceclass to the page on which it next supports or is hit by a differential. By default the \classoptions command adds options only to the most recent generation of the class in a sseqdata environment, or on the generation appropriate to the current page in a sseqpage environment. Using the generation option allows you to provide a single generation or range of generations of the class that the options should apply to. The first generation is generation 0, and the most recent generation is generation -1. Larger negative values count backwards.

3 2 1 0	0	0	3 2 1 0	0	•	3 2 1 0	0 %	3 2 1 0	2	3 2 1 0		•
	0	1		0	1		0 1		0 1		0	1

```
\begin{sseqdata}[name=page_example2, Adams grading,yscale=0.5]
\class(0,2)\class(1,0)
\d2(1,0)
\replaceclass(1,0)
\class(0,3)
\d3(1,0)
\replaceclass(1,0)
\classoptions[fill,red](1,0)% (a) applies to most recent (last) generation.
\end{sseqdata}

\printpage[name=page_example2,page=1] % generation 0 of (1,0), not styled
\begin{sseqpage}[name=page_example2,page=1,keep changes]
\classoptions[fill,blue](1,0) % (b) applies to the generation present on page 1, that is, generation 0.
\end{sseqpage}
\printpage[name=page_example2,page=2] % generation 0 of (1,0), so class is blue from (b)
\printpage[name=page_example2,page=3] % generation 1 of (1,0), class is not styled
\printpage[name=page_example2,page=4] % generation 2 of (1,0), class is red from (a)
```

```
\begin{sseqdata} [name=page_example2, Adams grading,update existing]
\classoptions[fill,red,generation=0-- -1](1,0)% (c) applies to all generations, overwrites (b) and (a).
\end{sseqdata}

\printpage [name=page_example2,page=1]% generation 0 of (1,0), so class is red
\begin{sseqpage} [name=page_example2,page=1,keep changes]
\classoptions[fill,blue](1,0) % (d) applies to the generation present on page 1, that is, generation 0.
\end{sseqpage}
\printpage [name=page_example2,page=2] % generation 0 of (1,0), class is blue from (d)
\printpage [name=page_example2,page=3] % generation 1 of (1,0), class is red from (c)
\printpage [name=page_example2,page=4] % generation 2 of (1,0), class is red from (c)
```

4.3 Options for \d and \structline

Because the main job of the \d and \structline commands is to print an edge on the appropriate pages of the spectral sequence, most TikZ options that you could apply to a TikZ "to" operator (as in \d x1,y1) to (x2,y2)) can be applied to both \d and \structline . Some such options are as follows:

```
\begin{array}{ll} \text{source anchor=}\langle anchor \rangle & \text{(no default)} \\ \text{target anchor=}\langle anchor \rangle & \text{(no default)} \end{array}
```

Because you can't use the normal TikZ mechanism for specifying the source and target anchors, sseqpages has these two keys for \d and \structline :

```
\begin{sseqpage} [no axes]
\foreach\x in {0,1} \foreach\y in {0,1}{
      \class(\x,\y)
}
\structline(0,0)(0,1)
\structline[source anchor=north west, target anchor=-30](1,0)(1,1)
\end{sseqpage}
```

```
\begin{array}{ll} \textbf{shorten} >= \langle distance \rangle & \text{(no default)} \\ \textbf{shorten} <= \langle distance \rangle & \text{(no default)} \\ \end{array}
```

These behave exactly like the corresponding options from tikz, shortening the end and beginning of the edge respectively. Note that you can lengthen the edge by shortening by a negative amount.

Dash patterns:

See the pgfmanual subsubsection titled "Graphic Parameters: Dash Pattern" for a complete explanation of the dash pattern related options. Some examples:

```
\begin{array}{ll} \mathbf{bend} \ \ \mathbf{left} = \langle angle \rangle & \text{(no default)} \\ \mathbf{bend} \ \ \mathbf{right} = \langle angle \rangle & \text{(no default)} \\ \mathbf{in} = \langle anchor \rangle & \text{(no default)} \\ \mathbf{out} = \langle anchor \rangle & \text{(no default)} \\ \end{array}
```

```
\begin{sseqpage} [no axes]
\foreach\x in {0,1,2} \foreach\y in {0,1}{
        \class(\x,\y)
}
\structline[bend left=20](0,0)(0,1)
\structline[bend right=20](1,0)(1,1)
\structline[in=20,out=north](2,0)(2,1)
\end{sseqpage}
```

5 Commands

```
\scalebox{sseqset}{\langle keys \rangle}
```

\sseqset is for adjusting the global options for all spectral sequences in the current scope. For instance, if most of the spectral sequences in the current document are going to be Adams graded, you can

say \sseqset{Adams grading} and all future spectal sequences in the current scope will have Adams grading (unless you specify a different grading explicitly). As another example, \sseqset{no axes} will suppress axes from spectral sequences in the current scope.

\foreach

This command is from TikZ and works in pretty much the same way in sseqpages. The \foreach command is very flexible and has a lot of variants. See the TikZ manual for more details.

```
\scalebox{$\backslash$ sseqnewcmd*$}(macro)(\langle x\ variable\ macro\rangle, \langle y\ variable\ macro\rangle)[\langle num\ args\rangle] {\cite{body}}
```

This command makes a new command with syntax similar to \class . By default it takes three arguments: $\mbox{mycommand}[\langle options \rangle](\langle x \rangle, \langle y \rangle)$. To access the $\langle options \rangle$ argument in the body of the command, use the macro $\mbox{options}$. Likewise to access $\langle x \rangle$, use \mbox{x} , and to access $\langle y \rangle$ use \mbox{y} :

```
\[
\begin{sseqnewcmd\featuregroup{
   \class[\options](\x,\y)
   \class[\options](\x,\y+1)
   \structline(\x,\y)(\x,\y+1)
\]
\[
\begin{sseqpage}
   \featuregroup[orange](0,0)
   \featuregroup[red](1,0)
   \end{sseqpage}
\]
\[
\begin{sseqpage}
\leftilde{\text{sseqpage}}
\leftilde{\text{sseqpage}}
\]
\[
\begin{sseqpage}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseqpage}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseqpage}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseq}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseq}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseq}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseq}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseq}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseq}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begin{sseq}
\leftilde{\text{seqpage}}
\leftilde{\text{seqpage}}
\]
\[
\begi
```

The unstarred version will throw an error if the command to be defined already exists. The starred variant will quietly overwrite the existing command. Note that the command is always defined globally. Sometimes it's inconvenient to use \x and \y as arguments, for instance if you want to use code that already uses them as iterators. In this case, you can specify other macros to use for the arguments:

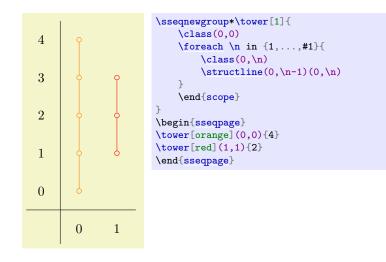

The command you create with \sseqnewcmd can take up to six arguments in addition to \options, \x, and \y. These extra arguments are mandatory and are delimited by braces.

```
\sseqnewcmd*\tower[1]{
                          \begin{scope}[\options]
4
                          \class(\x,\y)
                          \foreach \n in \{1, \ldots, #1\}{
                               \class(\x,\y+\n)
3
                              \t = (\x, \y+\n-1)(\x, \y+\n)
                          \end{scope}
2
                      \begin{sseqpage}
                      \tower[orange](0,0){4}
1
                      \tower[red](1,1){2}
                      \end{sseqpage}
0
       0
              1
```

```
\space{1mm} \spa
```

This is more or less a shorthand for

So that calling $\mbox{mygroup}(x,y)$ prints the whole group shifted to start at (x,y) instead of (0,0). For instance:

6 Global options

```
name = \langle sseq \ name \rangle  (no default)
```

This option must be used with the <u>sseqdata</u> environment where it indicates the name of the spectral sequence, which will be used with the <u>sseqdata</u> environment or \printpage command to draw the spectral sequence. The name used in a <u>sseqdata</u> environment must be new unless the environment is used with the <u>update existing</u> key in which case the <u>sseqdata</u> environment will add to the existing spectral sequence. It is optional when used with <u>sseqpage</u>, and if included the name given must be the name of an existing spectral sequence.

```
page=⟨page number⟩ (no default, initially 0)
```

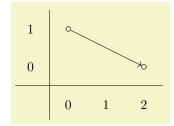

This key is for **sseqpage** and **\printpage**. It specifies which page of the spectral sequence is to be printed. On page r, all **\class**es that are not hit by differentials on pages less than r will be printed, as well as all **\structlines** whose source and target classes are both printed on page r, and all differentials of length exactly r. The special value **page=0** prints all classes, differentials, and structure lines.

```
\begin{array}{lll} \operatorname{degree} = & \langle x \ degree \rangle \} \\ & \langle y \ degree \rangle \} \\ & \langle no \ default \rangle \\ & \langle no \ value \rangle \\ & \langle n
```

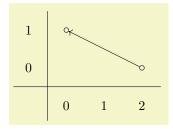

Specifies the degree of differentials. The $\langle x \ degree \rangle$ and $\langle y \ degree \rangle$ should both be mathematical expressions in one variable #1 that evaluate to integers on any input. They specify the x and y displacement of a page #1 differential. In practice, they will usually be linear expressions with #1 coefficient 1, -1, or 0.

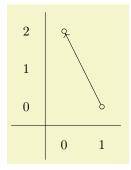

The degree option must be given before placing any differentials. It can be specified at the beginning of the sseqdata environment, at the beginning of the sseqpage environment if it is being used as a standalone page, or as a default by saying $seqset{degree}{\langle x \ degree \rangle}{\langle y \ degree \rangle}}$ or $seqset{Adams \ grading}$ outside of the sseqdata and sseqpages environments.

You can make a named grading convention by saying \sseqset{my grading/.sseq grading={ $\langle x \ degree \rangle$ }{ $\langle y \ degree \rangle$ }. Then later passing my grading to a spectral sequence is equivalent to saying degree={ $\langle x \ degree \rangle$ }{ $\langle y \ degree \rangle$ }. The following grading conventions exist by default:

```
\begin{sseqpage}[cohomological Serre grading]{\cite{cohomological Serre grading}}{\cite{cohomological Serre grading}}{\cite{cohomologica
```

```
\begin{sseqpage} [Adams grading] % equivalent to degree={-1}{#1-1}
\class(0,2)
\class(1,0)
\d2(1,0)
\end{sseqpage}
```

```
 \begin{array}{ll} \textbf{x} & \texttt{range=}\{\langle x \; min \rangle\} \{\langle x \; max \rangle\} \\ \textbf{y} & \texttt{range=}\{\langle y \; min \rangle\} \{\langle y \; max \rangle\} \end{array} \end{aligned}  (no default)
```

These options force the x and y range to be a specific interval. By default, if no range is specified then the range is chosen to fit all the classes. If an x range is specified but no y range, then the y range is chosen to fit all the classes that lie inside the specified x range, and vice versa.

```
grid=\{\langle grid\ style\rangle\} (no default)
```

Makes sseqpages draw a grid. The grid styles and a significant part of the code that produces them were stolen from sseq.sty.

3	0			0	3	0			0	3	0			0
2		000			2		000			2		. 000		
1			00		1			00		1			00	
0	0			0	0	0			0	0	0			0
	0	1	2	3		0	1	2	3		0	1	2	3
3					3	0			0					
2		-000			2		000							
1			00		1			00						
0					0	0			0					
	0	1	2	3		0	1	2	3					

```
\begin{sseqdata} [name=grid example]
\class(0,0)
\class(2,1)\class(2,1)
\class(1,2)\class(1,2)\class(1,2)
\class(3,3)
\class(3,3)
\end{sseqdata}
\text{vbox}{
\printpage [name=grid example,grid=chess]
\printpage [name=grid example,grid=crossword]
\printpage [name=grid example,grid=dots]
\newline
\printpage [name=grid example,grid=go]
\printpage [name=grid example,grid=none]
}
```

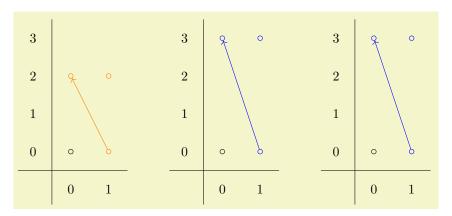

It is possible to make your own grid style by defining the command \sseq@grid@yourgridname to draw a grid.

update existing (no value)

This key is only for the <code>sseqdata</code> environment. It specifies that the current <code>sseqdata</code> environment is adding data to an existing spectral sequence. If you don't pass this key, then giving a <code>sseqdata</code> environment the same <code>name</code> as a different <code>sseqdata</code> environment will cause an error. This is intended to help you avoid accidentally reusing the same name.

$keep changes = \langle boolean \rangle$ (default true) (initially false)

This option is only for the <u>sseqpage</u> environment, and only works when a <u>name</u> is provided. This option specifies that all of the commands in the current <u>sseqpage</u> environment should be carried forward to future pages of the same named spectral sequence. For example:

```
\begin{sseqdata} [name=keep changes example, Adams grading, y range={0}{3}]
\class(0,0)
\class(1,0)
\end{sseqdata}
\begin{sseqpage} [name=keep changes example, sseq=orange]
\class(0,2)
\class(1,2)
\classoptions[orange](1,0)
d2(1,0)
\end{sseqpage}
\hskip1cm
\begin{sseqpage} [name=keep changes example, sseq=blue, keep changes]
\class(0.3)
\class(1,3)
\classoptions[blue](1,0)
\d3(1,0)
\end{sseqpage}
\hskip1cm
\printpage[name=keep changes example,page=3]
```

Note that the orange classes and differential do not persist because the <u>keep changes</u> option is not set in the first <u>sseqpage</u> environment, but the blue classes and differential do, since the <u>keep changes</u> option is set in the second <u>sseqpage</u> environment.

```
no differentials (no value)
draw differentials (no value)
```

The option no differentials suppresses all of the differentials on the current page, whereas draw differentials causes the page appropriate differentials to be drawn. This is useful for explaining how the computation of the spectral sequence goes:

```
no struct lines (no value) draw struct lines (no value)
```

The option no struct lines suppresses all of the structure lines on the current page, whereas the option draw struct lines causes the page appropriate structure lines to be drawn.

```
no orphan edges (no value) draw orphan edges=\langle boolean \rangle (default true) (initially true)
```

An edge is an "orphan" if both its source and target lie off the page. By default these are drawn, but with the option no orphan edges they are not. If the option no orphan edges has been set, draw orphan edges undoes it.

2		··. \		2			
1			\`. \`.	1			<i>~</i>
0				0			
	0	1	2		0	1	2

```
begin{sseqdata}[
    name=orphan edges example,
    cohomological Serre grading,
    x range={0}{2}, y range={0}{2}]

class(0,3) class(3,1)

d3(0,3)

class(2,1) class(4,0)

d2(2,1)

end{sseqdata}

printpage[name=orphan edges example]

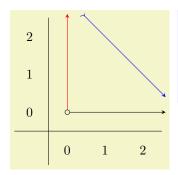

hskip1cm

printpage[name=orphan edges example,
    no orphan edges]
```

```
 \begin{array}{lll} & \text{run off=}\{\langle start\ arrow\rangle\}\{\langle end\ arrow\rangle\} & & \text{(no default)} \\ & \text{run off struct lines=}\{\langle start\ arrow\rangle\}\{\langle end\ arrow\rangle\} & & \text{(no default, initially } \ldots \ldots) \\ & \text{run off differentials=}\{\langle start\ arrow\rangle\}\{\langle end\ arrow\rangle\} & & \text{(no default, initially } \ldots \ldots) \\ \end{aligned}
```

Change the default behavior of run off edges for either all edges, just struct lines, or just differentials respectively. Local arrowhead options override this.

If an edge runs off the edge of the clipping, sseqpages automatically add an arrowhead to indicate that the edge continues. This option controls which arrow head is added if the start or end of an edge runs off the page.

```
\begin{sseqpage} [x range={0}{2},y range={0}{2},draw orphan edges,run off={>}{stealth}] \class(0,0) \class(3,0)\class(0,3) \structline(0,0)(3,0) \structline[red](0,0)(0,3) \structline[blue](3,0)(0,3) \end{sseqpage}
```

$\verb|class| pattern = \langle class| pattern| name \rangle$

(no default, initially standard)

This key specifies the arrangement of multiple classes at the same coordinate. The default value is standard.

```
\begin{sseqdata} [name=class pattern example, no axes, ymirror]
\class(0,0)
\class(1,0)\class(1,0)
\class(0,1)\class(0,1)\class(0,1)
\class(1,1)\class(1,1)\class(1,1)\class(1,1)
\class(0,2)\class(0,2)\class(0,2)\class(0,2)\class(0,2)
\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\class(1,2)\cl
```

You can add new class patterns using \sseqnewclasspattern:

```
\scalebox{$\scalebox{$\sim$}} \scalebox{$\sim$} \scaleb
```

Creates a new class pattern. For example, the linear class pattern is created using the command:

```
\newsseqclasspattern{linear}{
    (0,0);
    (-0.13,0)(0.13,0);
    (-0.2,0)(0,0)(0.2,0);
    (-0.3,0)(-0.1,0)(0.1,0)(0.3,0);
    (-0.4,0)(-0.2,0)(0,0)(0.2,0)(0.4,0);
    (-0.5,0)(-0.3,0)(-0.1,0)(0.1,0)(0.3,0)(0.5,0);
}
```

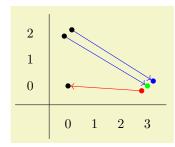

For instance the third row indicates that if there are three classes at the position (x,y) they should be printed at (x-0.2,y), (x,y), and (x+0.2,y). You can give as many rows as you like; sseqpages will throw an error if there are more classes in any position than the maximum number that your class pattern can handle – for instance, the linear class pattern can handle up to six classes based on this definition.

class placement transform= $\{\langle transform \ keys \rangle\}$

(no default)

The option class placement transform allows the user to specify a Tikz coordinate transform to adjust the relative position of multiple nodes in the same (x,y) position. This coordinate transform can only involve rotation and scaling, no translation. Specifying a scaling factor helps if the nodes are too large and overlap. In some cases a rotation makes it easier to see which class is the target of a differential.

1		$\mathbb{Z}/2 \mathbb{Z}/3$
0	\mathbb{Z}	
	0	1

```
\verb|math| \verb|nodes=| \langle boolean \rangle|
```

(default true) (initially false)

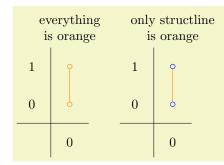

This key instructs sseqpages to put all labels in math mode automatically.

6.1 Styles

The sseqpages package has a large number of styles which control the appearance of specific components (e.g., classes, differentials, or structlines) of a spectral sequence. Each style has two corresponding keys: classes and change classes. Sayingclasses=\marg{keys} adds the keys to the list of options used to style every future class, whereas change classes=\marg{keys} only makes sense in a sseqpage environment, and temporarily overwrites the list of options. Note that change classes only applies to classes that existed before the current page, and that even with the keep_changes option, the change classes options are local to the current page. Compare:

cha	ange ne	ew classes	change old classes					
1	•	0	1	0	•			
0	0	•	0	•	0			
	0	1		0	1			

In cases where the same drawing feature is affected by multiple of these styles, the more specific style takes precedence. For instance, for a class that is the source or target of a differential on the current page, the precedence order from lowest to highest goes: sseq style, class style, transient cycle style, this page cycle style, and then any options from scopes in the order they appear, and any local options (the options that come right with the class, e.g., \class[local options](x,y)). If you don't want the options to your scopes to override more specific styles, use sseq:

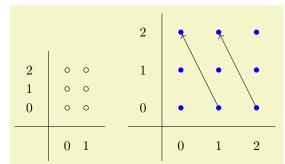

```
\begin{sseqpage}[classes=blue,
    title style={align=center,text width=2.4cm},
    title={everything is orange}]
\begin{scope} [orange]
\class(0,0)\class(0,1)
\operatorname{tructline}(0,0)(0,1)
\end{scope}
\end{sseqpage}
\begin{sseqpage}[classes=blue,
    title style={align=center,text width=2.4cm},
    title={only structline is orange}]
\begin{scope} [sseq=orange]
\class(0,0)\class(0,1)
\operatorname{tructline}(0,0)(0,1)
\end{scope}
\end{sseqpage}
```

There are also options

Throughout, "class" and "cycle" are synonyms.

```
sseqs=\{\langle keys \rangle\}  (no default) 
 change sseqs=\{\langle keys \rangle\}  (no default)
```

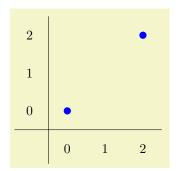

This passes global options to all future spectral sequences in the current scope. It is only useful to use this command with \sseqset. This is only really important for TikZ options, because for most options from sseqpages you can set a default directly by saying \sseqset{key={ $\langle value \rangle}}$ }.

```
% Applies to both of the following sseqs:
%\sseqset{scale=0.5}
\verb|\begin{sseqpage}| [scale=0.5]|
\foreach \x in \{0,1\}
\foreach \y in \{0,1,2\}{
    \class(\x,\y)
\end{sseqpage}
\hskip0.5cm
\begin{sseqpage}[
    Adams grading,
    classes={fill,blue}
\foreach \x in \{0,1,2\}
\foreach \y in \{0,1,2\}{
    \class(\x,\y)
\d2(1,0)
d2(2,0)
\end{sseqpage}
```

```
 \begin{array}{c} \textbf{classes=}\{\langle keys \rangle\} \\ \textbf{cycles=}\{\langle keys \rangle\} \end{array}  (no default)
```

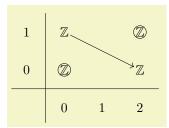

The keys classes and cycles are synonyms.

```
\begin{seepage} [classes=\{blue,fill,minimum\ width=0.5em\}] \\ \class(0,0) \\ \class(2,2) \\ \end{seepage} \end{seepage}
```

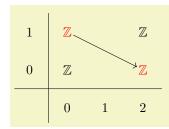

```
\begin{array}{ll} \operatorname{permanent\ classes=\{\langle keys\rangle\}} & \text{(no\ default)} \\ \operatorname{permanent\ cycles=\{\langle keys\rangle\}} & \text{(no\ default)} \\ \operatorname{change\ permanent\ classes=\{\langle keys\rangle\}} & \text{(no\ default)} \\ \operatorname{change\ permanent\ cycles=\{\langle keys\rangle\}} & \text{(no\ default)} \\ \end{array}
```

These options change the appearance of all permanent cycles (e.g., those classes which never support or are hit by a differential). For instance, we can circle the permanent cycles automatically. Note that because permanent cycles is more specific than classes, the permanent cycles={draw} command wins out over the class={draw=none} command to insure that the permanent cycle nodes are drawn.

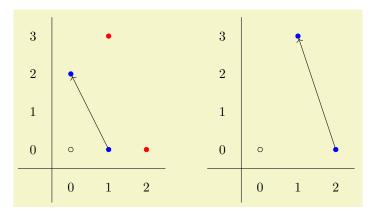

```
 \begin{array}{lll} \text{transient classes=} \{\langle keys \rangle\} & \text{(no default)} \\ \text{transient cycles=} \{\langle keys \rangle\} & \text{(no default)} \\ \text{change transient classes=} \{\langle keys \rangle\} & \text{(no default)} \\ \text{change transient cycles=} \{\langle keys \rangle\} & \text{(no default)} \\ \end{array}
```

These options change the appearance of all transient cycles (e.g., those classes which eventually support or are hit by a differential). Again, this takes precedence over the classes option.

```
this page classes=\{\langle keys \rangle\} (no default) this page cycles=\{\langle keys \rangle\} (no default) change this page classes=\{\langle keys \rangle\} (no default) change this page cycles=\{\langle keys \rangle\} (no default)
```

These options change the appearance of all cycles which support or are hit by a differential on this page. Any class that is hit on the current page is also a transient cycle, and so this page classes takes precedence over transient cycles

```
\begin{array}{lll} \operatorname{edges} = & \langle keys \rangle \\ \operatorname{differentials} = & \langle keys \rangle \\ \operatorname{struct\ lines} = & \langle keys \rangle \\ \operatorname{change\ edges} = & \langle keys \rangle \\ \operatorname{change\ differentials} = & \langle keys \rangle \\ \operatorname{change\ struct\ lines} = & \langle keys \rangle \\ \operatorname{change\ struct\ lines} = & \langle keys \rangle \\ \end{array}
```

The edges key applies to both differentials and structure lines. The differentials and struct_lines keys both take precedence over edges.

```
this page struct lines=\{\langle keys \rangle\} (no default) change this page struct lines=\{\langle keys \rangle\} (no default)
```

This style applies to structure lines whose source or target is hit on the current page. It takes precedence over struct lines.

```
tikz primitives=\{\langle keys \rangle\} (no default) change tikz primitives=\{\langle keys \rangle\} (no default)
```

Applies to all tikz primitives.

This style applies to labels on classes, differentials, and structlines. All the more specific label styles take precedence over it.

```
\begin{array}{lll} {\rm class\ labels=\{\langle keys\rangle\}} & & {\rm (no\ default)} \\ {\rm inner\ class\ labels=\{\langle keys\rangle\}} & & {\rm (no\ default)} \\ {\rm outer\ class\ labels=\{\langle keys\rangle\}} & & {\rm (no\ default)} \\ {\rm change\ class\ labels=\{\langle keys\rangle\}} & & {\rm (no\ default)} \\ {\rm change\ inner\ class\ labels=\{\langle keys\rangle\}} & & {\rm (no\ default)} \\ {\rm change\ outer\ class\ labels=\{\langle keys\rangle\}} & & {\rm (no\ default)} \\ \end{array}
```

Inner class labels specifically applies to class labels that are inside the node, outer class labels specifically applies to ones outside it:

```
\begin{sseqpage} [no axes, classes={inner sep=0.1cm},
    outer class labels={red},
    inner class labels={blue}]
\class["a", "b" above](0,0)
\class["a", "c" right](1,0)
\end{sseqpage}
```

```
\begin{array}{lll} & \text{edge labels=}\{\langle keys \rangle\} & \text{(no default)} \\ & \text{differential labels=}\{\langle keys \rangle\} & \text{(no default)} \\ & \text{struct line labels=}\{\langle keys \rangle\} & \text{(no default)} \\ & \text{change edge labels=}\{\langle keys \rangle\} & \text{(no default)} \\ & \text{change differential labels=}\{\langle keys \rangle\} & \text{(no default)} \\ & \text{change struct line labels=}\{\langle keys \rangle\} & \text{(no default)} \\ \end{array}
```

6.2 Global Coordinate Transformations

Of the normal TikZ coordinate transformations, only the following can be applied to a sseq diagram:

Scale the diagram by $\langle factor \rangle$. Under normal circumstances, you can tell TikZ to mirror a diagram by saying, for instance, xscale=-1, but sseqpages needs to be aware that the diagram has been mirrored in order to draw the axes correctly. Thus, if you want to mirror a spectral sequence, use the xmirror and ymirror options as appropriate.

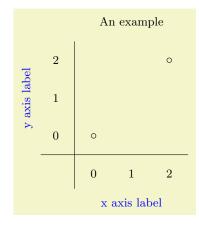

```
rotate = \langle angle \rangle (no default)
```

It probably won't look great if you pick an angle that isn't a multiple of 90 degrees.

6.3 Axes Style

```
title = \langle text \rangle (no default)
```

```
\begin{array}{lll} \operatorname{title} \ \operatorname{style} = & \langle \operatorname{options} \rangle & \text{(no default)} \\ \text{x } \ \operatorname{label} = & \langle \operatorname{text} \rangle & \text{(no default)} \\ \text{y } \ \operatorname{label} = & \langle \operatorname{options} \rangle & \text{(no default)} \\ \text{y } \ \operatorname{label} \ \operatorname{style} = & \langle \operatorname{options} \rangle & \text{(no default)} \\ \text{label} \ \operatorname{style} = & \langle \operatorname{options} \rangle & \text{(no default)} \\ \text{label} \ \operatorname{style} = & \langle \operatorname{options} \rangle & \text{(no default)} \\ \end{array}
```

```
\begin{sseqpage}[title={An example},
    x label={x axis label}, y label={y axis label},
    label style={blue,font=\small},
    x label style={yshift=10pt}, y label style={xshift=10pt}]
\class(0,0)
\class(2,2)
\end{sseqpage}
```

```
no title
draw title
no x label
no y label
draw x label
draw x label
draw y label
(no value)
(no value)
(no value)
(no value)
```

Suppress or unsuppress the title, x label, or y label respectively.

```
no x axis

no y axis

no axes

(no value)

no axes

(no value)

draw x axis

(no value)

draw y axis

(no value)

draw axes

(no value)
```

Suppress the axis. Also suppresses axes ticks. If there is a title or axes labels they will still be drawn. You can draw your own axes using tikz inside a scope environment with the background key.

```
no x ticks(no value)no y ticks(no value)no ticks(no value)draw x ticks(no value)draw y ticks(no value)draw ticks(no value)
```

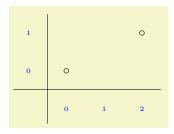

Suppress axes ticks (the numbers next to the axes). Only matters if axes are drawn. You can make your own ticks using tikz inside a scope environment with the background key. For instance, you might want to label the axes as $0, n, 2n, \ldots$ You can achieve this as follows: (you can also use x tick function).

```
\begin{sseqpage} [no x ticks, x range={0}{3}]
\begin{scope} [background]
    \node at (0,\ymin - 1) {0};
    %\vphantom is fragile so we have to throw in an extra \protect =(
    \node at (1,\ymin - 1) {\protect\vphantom{2}n};
\foreach \n in {2,..., \xmax}{
    \node at (\n,\ymin - 1) {\n n};
}
\end{scope}
\class(0,0)
\class(3,2)
\end{sseqpage}
```

```
x tick step=\langle positive integer\rangle
y tick step=\langle positive integer\rangle
tick step=\langle positive integer\rangle
Sets the interval between labels.

x tick style={\langle keys\rangle}
y tick style={\langle keys\rangle}
(no default)
y tick style={\langle keys\rangle}
(no default)
tick style={\langle keys\rangle}
(no default)
```

Change the tick style:

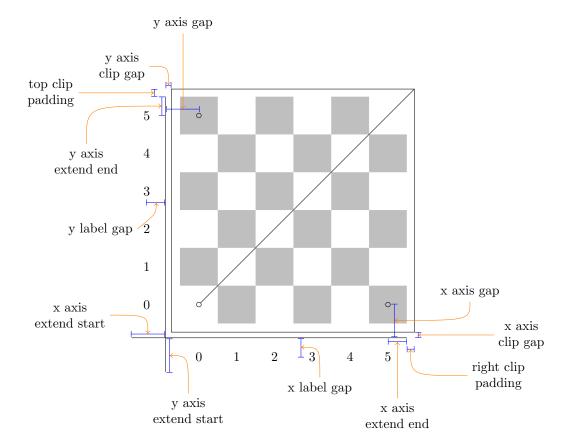

```
x tick function=\langle function \rangle (no default, initially #1)
y tick function=\langle function \rangle (no default, initially #1)
tick function=\langle function \rangle (no default, initially #1)
```

A function that takes in the current x value and outputs the appropriate tick.

6.4 Layout

```
x axis gap=\langle dimension \rangle(no default, initially 0.5cm)y axis gap=\langle dimension \rangle(no default, initially 0.5cm)axes gap=\langle dimension \rangle(no default, initially 0.5cm)
```

```
x label gap=\langle dimension \rangle
                                                                                               (no default, initially 0.5cm)
y label gap=\langle dimension \rangle
                                                                                               (no default, initially 0.5cm)
x axis start extend=\langle dimension \rangle
                                                                                               (no default, initially 0.5cm)
  axis start extend=\langle dimension \rangle
                                                                                               (no default, initially 0.5cm)
x axis end extend=\langle dimension \rangle
                                                                                               (no default, initially 0.9cm)
  axis end extend=\langle dimension \rangle
                                                                                               (no default, initially 0.9cm)
x axis clip padding=\langle dimension \rangle
                                                                                               (no default, initially 0.1cm)
y axis clip padding=\langle dimension \rangle
                                                                                               (no default, initially 0.1cm)
right clip padding=\langle dimension \rangle
                                                                                               (no default, initially 0.1cm)
left clip padding=\langle dimension \rangle
                                                                                               (no default, initially 0.4cm)
                                                                                               (no default, initially 0.1cm)
top clip padding=\langle dimension \rangle
bottom clip padding=\langle dimension \rangle
                                                                                               (no default, initially 0.4cm)
```

$custom clip=\langle clip path \rangle$ (no default)

Give a custom clipping. The clipping specified must be in the form of a valid TikZ path, for instance $\clip(0,0)$ rectangle (10,10);. See the TikZ manual for more details on clippings. This clipping is also applied to any grid and is used to draw ellipses on appropriate differentials or struct lines that go out of bounds and to determine whether a differential or struct line is an "orphan". It is not applied to any background elements, which is important because these are often used for axes labels and such that should lie outside of the clipping region.

clip=\langle boolean \rangle (default true) (initially true)

If this is false the spectral sequence won't be clipped. I'm not really sure why you would want that, but there might be some use case.

$\verb|rotate labels=|\langle boolean \rangle|$

(default true)(initially false)

If you use rotate=90 but also want the labels rotated (so that the whole diagram is sideways) use this key.
